43. (C) Sum of first-15 +ve whole numbers
 $= \frac{15 \times 16}{2} = 120$

Their average = $\frac{120}{15} = 8$

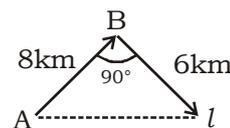

44. (D)

45. (A)

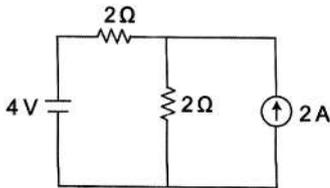

These are triangles in the given figures
 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13
 (1, 2), (2, 3), (3, 4), (6, 7), (7, 8), (8, 9),
 (10, 11), (11, 12), (12, 13), (1, 2, 3), (2, 3, 4),
 (6, 7, 8), (10, 11, 12), (11, 12, 13), (1 to 4),
 (6 to 9), (10 to 13) and (1 - 13)

46. (D)

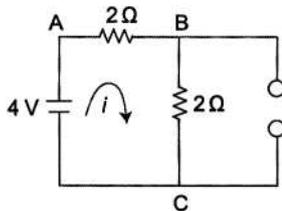

Required distance a = $\sqrt{AB^2 + AC^2}$
 $= \sqrt{8^2 + 6^2} = \sqrt{64 + 36}$
 $= \sqrt{100} = 10 \text{ km}$

187. (B) In order to calculate the total power consumed in the circuit. First off all calculate the net current in the circuit element by using superposition theorem.

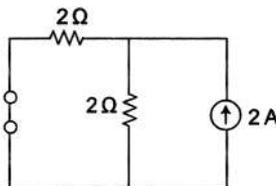

Case I . Take 4V source

$$i = \frac{4}{4} = 1 \text{ amp. (A} \rightarrow \text{B} \rightarrow \text{C)}$$

Case II. Take 2A source here current in each 2 Ω resistance will be 1 amp. (B → A and B → C)

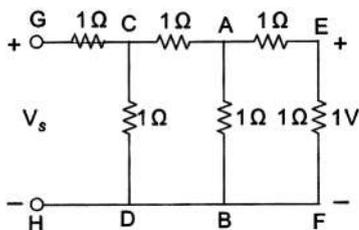

Net current in branch AB resistance
 $R = 1 - 1 = 0$

Net current in branch BC resistance
 $R_{BC} = 1 + 1 = 2 \text{ amp.}$

Power consumed in branch BC = $I^2 R_{BC} = 2^2 \cdot 2 = 8 \text{ W}$

188. (D) Current in branch EF = $\frac{1}{1} = 1 \text{ amp}$

Current in Branch AB = $\frac{V_{AB}}{1\Omega} = \frac{2}{1} = 2 \text{ amp}$

Current in branch CA = $1 + 2 = 3 \text{ amp.}$

Current in

$$CD = \frac{V_{CD}}{1} = \frac{V_{CA} + V_{AB}}{1}$$

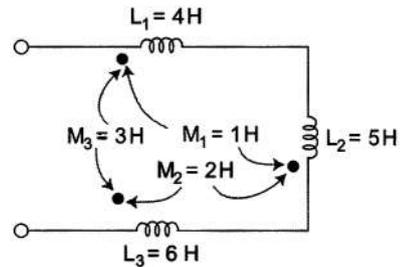

$$= \frac{3 \times 1 + 2 \times 1}{1}$$

$$= 5 \text{ amp}$$

Current in branch GC = $5 + 3 = 8 \text{ amp}$

$$\begin{aligned} \text{Now, } V_s &= V_{GC} + V_{CD} \\ &= 1 \times 8 + 1 \times 5 \\ &= 13 \text{ V} \end{aligned}$$

190. (C) $L_{eq} = L_1 + L_2 + L_3 - 2M_1 + 2M_2 - 2M_3$

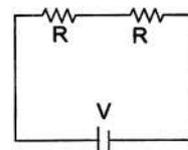

$$\begin{aligned} &= 4 + 5 + 6 - 2 \times 1 + 2 \times 2 - 2 \times 3 \\ &= 15 - 2 + 4 - 6 \\ &= 11 \text{ H} \end{aligned}$$

191. (D) Let the network contains two resistors in

$$I = \frac{V}{2R} \text{ or } V = 2IR \quad \dots(1)$$

If the value of resistance increases to two times

I becomes $\frac{1}{2}$ and R becomes 2R.

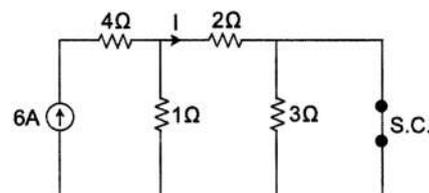

so new voltage

$$V' = 2 \cdot \frac{1}{2} \cdot (2R) = 2IR = V$$

Hence, alternative (D) is correct.

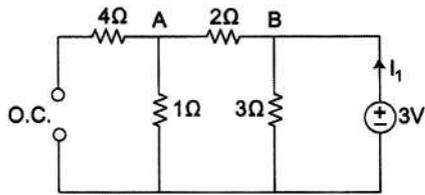

192. (C) On applying superposition theorem.

Case I. Taken current source in this situation the 6A circuit becomes.

$$I = \frac{6 \times 1}{2 + 1} = 2 \text{ (A} \rightarrow \text{B)}$$

Case II. Taken voltage source : In this situation the circuit becomes

Note : Here 3 Ω resistance is a extra element because voltage at node B is independent of the resistance 3 Ω.

$$I_1 = \frac{3}{2+1} = 1 \text{ amp (B} \rightarrow \text{A)}$$

The net current in 2 Ω resistance

$$i = I - I_1 = 2 - 1 = 1 \text{ amp. (A} \rightarrow \text{B)}$$

193. (C) Given that network has 7 nodes and 5 independent loop.

$$B - L + 1 = \text{nodes}$$

$$B - 5 + 1 = 7$$

$$B = 12 - 1 = 11$$

194. (D)

$$f_1 = \frac{1}{2\pi\sqrt{L_{eq}C}}$$

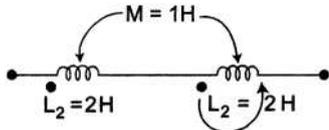

here

$$L_{eq} = L_1 + L_2 - 2M$$

$$= 2 + 2 - 2 \times 1 = 2$$

so

$$C = 1 \text{ F}$$

$$f_r = \frac{1}{2\pi\sqrt{2 \times 1}} = \frac{1}{2\pi\sqrt{2}}$$

195. (B) Nodal at V_x

$$\frac{V_x}{2} + \frac{V_x - 20}{5} = 8$$

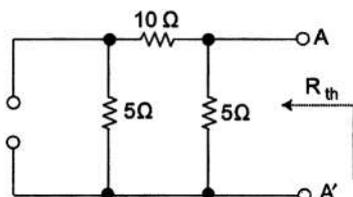

$$7V_x - 40 = 80$$

$$7V_x = 120$$

$$V_x = \frac{120}{7}$$

196. (C) Calculation for R_{th}

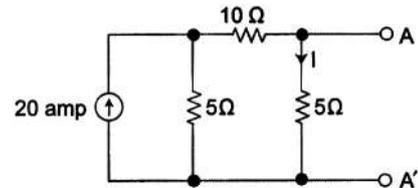

$$R_{th} = 15 \parallel 5 = \frac{15 \times 5}{15 + 5}$$

$$\text{or } R_{th} = \frac{75}{20} = \frac{15}{4} \text{ W}$$

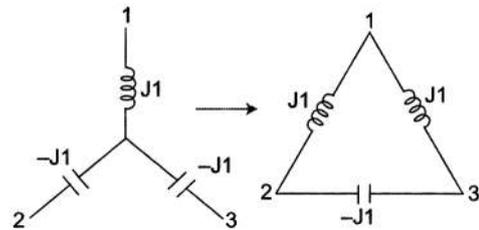

Calculation for V_{th}

$$I = 20 \times \frac{5}{5+15} = 5 \text{ amp.}$$

$$V_{th} = I \times 5 = 5 \times 5 = 25 \text{ V}$$

199. (A) This can be solved by using Star to Delta transformation.

$$R_{12} = \frac{R_1 R_2 + R_2 R_3 + R_3 R_1}{R_3}$$

$$= \frac{J1 \times -J1 + (-J1)(-J1) + (-J1) \times (J1)}{-J1}$$

$$= \frac{-J^2 + J^2 - J^2}{-J} = +J$$

$$R_{23} = \frac{R_1 R_2 + R_2 R_3 + R_3 R_1}{R_1} = \frac{-J^2}{J} = -J$$

$$R_{31} = \frac{R_1 R_2 + R_2 R_3 + R_3 R_1}{R_2} = \frac{-J^2}{-J} = J$$
